Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application.

1.(currently amended): A method for recommending information, including ~~the steps of~~:

a. receiving ~~the~~ information which includes ~~the~~ specific information characteristics;

b. matching said received information with a fuzzy user file which includes ~~the~~ a user's selecting characteristic by inference of ~~the~~ fuzzy logic; and

c. recommending ~~the~~ matched information ~~which conforms~~ according to ~~the~~ predetermined conditions to the user according to the matching result.

2.(currently amended): The method according to claim 1, further including ~~the step of~~:

updating said fuzzy user file according to ~~the~~ a user's feedback ~~for~~ from the recommended information.

3.(currently amended): The method according to claim 2, wherein ~~the method for~~ said updating the fuzzy user file includes:

judging the ~~actual~~ user's actual interest-degree according to ~~the~~ a relative ratio of ~~the~~ an amount of time in which the user watches the recommended information to an amount of ~~the~~ time in which said recommended information is ~~predetermined to~~ actually broadcast ~~actually~~, thereby ~~to update~~ updating the user's parameters.

4.(currently amended): The method according to claim 1, wherein said selecting characteristic includes a ternary array which includes ~~the~~ content characteristic, ~~the~~ a preference and ~~the~~ a weight.

5.(currently amended): The method according to claim 4, wherein said preference represents ~~the~~ degrees of ~~the~~ a user's likes and dislikes.

2

6.(currently amended): The method according to claim 4, wherein the preference and the weight of said selecting characteristic is expressed with ~~the~~ a fuzzy set.

7.(currently amended): The method according to claim 4, wherein said fuzzy user file can be expressed with the following vector formula of the ternary array:

$$UP = ((t_1, ld_1, w_1), (t_2, ld_2, w_2), ...(t_i, ld_i, w_i)....., (t_m, ld_m, w_m))$$

wherein (ti, ldi, wi) is ~~a~~ said selecting characteristic, ~~ti~~ t_i is a content characteristic, i is ~~the~~ a serial number of the content characteristic t_i, ld_i is the preference for the selecting characteristic, w_i is the weight of the selecting characteristic.

8.(currently amended): The method according to claim 1, wherein said fuzzy user file is established in a fuzzy manner.

9.(currently amended): The method according to claim 1, wherein said step b includes ~~the steps of~~:

i. matching the specific information characteristic of said information with ~~the~~ a relative selecting characteristic in said fuzzy user file to obtain the user's interest-degree for said specific information characteristic by inference of the fuzzy logic; and

ii. obtaining the user's comprehensive interest-degree for said information according to ~~the~~ an obtained interest-degree for said specific information characteristic.

10.(currently amended): The method according to claim 9, wherein said step i includes the steps of:

A. establishing a transforming mode for ~~the~~ an input variable with multi-input and ~~a~~ single-output, said input variable being the user's selecting characteristic, said output variable being the interest-degree for the specific information characteristic;

B. fuzzing said selecting characteristic and said interest-degree for the specific information characteristic;

      C. making a fuzzy process for the fuzzed selecting characteristic to obtain ~~the~~ a fuzzed interest-degree for the specific information characteristic;

      D. de-fuzzing the processing result to obtain ~~the~~ a definite value of ~~the~~ interest-degree for the specific information characteristic.

11.(currently amended):   The method according to claim 10, wherein said step ii including ~~the steps of~~:

      A. establishing a transforming mode for the input variable with multi-input and single-output, said input variable being the interest-degree for the specific information characteristic, said output variable being the comprehensive interest-degree for the information;

      B. mapping said interest-degree for the specific information characteristic to ~~the~~ a comprehensive interest-degree for the information obtained with the fuzzy set.

12.(currently amended):   ~~An~~ A system for information recommending, ~~including~~comprising:

      information receiving means for receiving ~~the~~ information which includes ~~the~~ specific information characteristic;

      fuzzy matching means for matching the received information with a fuzzy user file which includes the user's selecting characteristic by inference of ~~the~~ fuzzy logic;

      sieving means for recommending the matched information according~~which conforms~~ to ~~the~~ predetermined conditions to the user according to the matching result.

13.(currently amended):   The system according to claim 12, further ~~including~~comprising:

      user communicating means for a user's communicating ~~the~~ information with said system.

14.(currently amended):   The system according to claim 12, further ~~including~~comprising:

user file revising means for updating the ~~fuzzy user~~user's file according to ~~the~~ ~~user's~~user feedback ~~for~~of the recommended information.

15.(currently amended):   The system according to claim 12, further ~~including~~comprising:

fuzzy user file managing means for storing the ~~fuzzed~~fuzzy user ~~files~~file.

16.(new) The method according to claim 1, wherein the predetermined condition includes thresholds for ordering the matched information according to values of interest-degrees respectively, and generating a recommendation table for the user.
